Telephone: 01273 664696

Head and Neck ward, Level 8A West
01273 696955 Ext.4357 / 4358

Maxillofacial Outpatients Appointments
01273 696955 Ext.63990

The nursing team and speech and language therapist will help and advise.

How will my speech be affected?
The effects on your speech will depend on how much of the tongue is removed and how it is repaired, but you will be able to speak and be understood. Your speech may sound thick or slurred but will improve with therapy and time. Many patients successfully return to their jobs, which may involve a good deal of speaking e.g. teachers, salesmen, receptionists etc.

How will my eating and drinking be affected?
Normally, for the first few days whilst you are recovering from surgery you will not feel much like eating or drinking, so you may be fed by a tube either from your nose into your stomach (a Naso-Gastric or NG tube) or directly into your stomach (a PEG or RIG Percutaneous Endoscopic Gastrostomy or Radiologically Inserted Gastrostomy).

This will be explained to you at your pre-assessment. These tubes will also be used to give you your medication.

Once your mouth has healed sufficiently and your surgeon agrees, you will be assessed by a speech and language therapist who will advise you on eating and drinking. At first you will find it difficult to chew and prepare solid foods and liquids will be easier, but please be reassured that most patients are able to eat and drink relatively normally after a period of rehabilitation with the speech & language therapist.'
Will it be painful?

There may be some pain at first after surgery. Often this is slight and will be well controlled with painkillers. Different parts of the body heal at different rates and you may need painkillers on discharge until you feel comfortable.

Scarring

Any surgery will result in a scar. However, these scars will certainly fade with time and vary in their visibility. The areas of your body, which may receive scarring, are:

- the middle of your chin and lower jaw if your tumour is difficult to reach
- the area of your body where the ‘flap’ is removed
- the side of your neck if it is necessary to remove lymph glands in the neck to remove cancerous glands and prevent the cancer from spreading.

You will be given advice on how to reduce scar tissue from your Macmillan nurse. A camouflage therapist can offer help and advice once your wounds are fully healed.

The psychological therapy team are also available and can provide opportunity (or opportunities) to explore thoughts and feelings about your altered appearance together with a range of coping strategies.

How will the surgery (operation) affect me?

The function of the tongue

The tongue is a highly specialised muscle used for:

Speech – a variety of small movements made by the tongue alter the shape of the mouth to help produce most of the individual sounds used in speech.

Chewing – the lips, tongue, teeth and jaws work together to break up food and form it into a soft ball for swallowing.

Swallowing – the tongue carries food and drink to the back of the mouth where they are swallowed down your throat and into your oesophagus (swallowing tube).

Taste – The tongue is divided into different areas for tasting salt, sour, bitter and sweet.

You may experience some changes in all of these functions.

Will my voice be affected?

Your voice is made in your larynx (voice box) situated at the top of your windpipe. It is not usually affected by surgery, so you will have your normal voice. However, sometimes your surgeon may wish to place a breathing tube (tracheostomy) temporarily into your windpipe or trachea.

The reasons why and the procedure will be fully explained to you. As it is placed below your larynx it means that temporarily you will have no voice or even a whisper. Your speech and language therapist will have prepared you for this at pre-assessment and advised on various alternative methods of communication such as:

- pen and paper
- magic eraser board
- picture chart and others.

The tracheostomy tube will be removed quickly and easily once your surgical team has made that decision. Your voice and breathing will return to normal.

What is a partial or hemi-glossectomy?

It means the removal of a part or half of the tongue. How much of the tongue that is removed depends on the size of the cancer and where it is.

The area removed is usually replaced by a piece of skin and/or muscle (known as a ‘flap’) taken from another part of your body, such as the smooth side of your forearm. Your surgeon will explain exactly how this is done.

Pre-operatively

The doctors will discuss your surgery with you at the outpatient appointment. Please ask if you do not understand any terms, they use. You will also be given the opportunity to see the Macmillan Head and Neck Nurse Specialist’s and Support Worker.

A pre-assessment will be carried out about a week before your operation. This will usually involve seeing the surgeon, anaesthetist, specialist nurse, speech and language therapist and dietitian.

This leaflet is a guide to the care you will receive. However, as your treatment is planned very carefully and individually, your medical team will explain the care that you personally will receive.

The length of stay may be approximately anytime up to two weeks, depending on the extent of surgery and your general health. Please remember that this is just a guide and the care of each person will differ according to his or her needs.
